

Roll-a-Ball game in Pokemon Style

This project aims to develop a basic yet dynamic Roll-a-Ball game prototype inspired by the Pokémon universe, focusing on precision movement and timed survival.

Game Goals:

- Configuring the lighting and the game background (Skybox) to establish an engaging visual atmosphere.
- Creating and positioning 3D objects (obstacles like wall, tree, rock).
- Creating finish line where player can finish the game when reached.
- Adding a background sound make the game more fun.
- Making it multiplayer ?????

Gameplay Mechanics:

Player Object: The player controls a **Poké Ball** that rolls through the game.

Collectables/Score: There will be **Pokémon** Scattered throughout the map which the player must collect. Each collected Pokémon adds to the player's score. The collected Pokémon also serve as a form of **defense score**.

The Threat (AI): One **AI-controlled enemy Pokémon** will relentlessly pursue the player's Poké Ball.

Win/Loss Conditions:

- **Loss Condition:** The enemy Pokémon catches the player's Poké Ball, and the player is **out of collected Pokémon** (i.e., the score is zero).
- **Win Condition:** The player successfully rolls the Poké Ball to the **designated Exit Point** before the enemy Pokémon catches them, securing the collected Pokémon.
